Širjenje svetlobe po optičnih vlaknih: svetloba nosi tisoče informacijskih kanalov

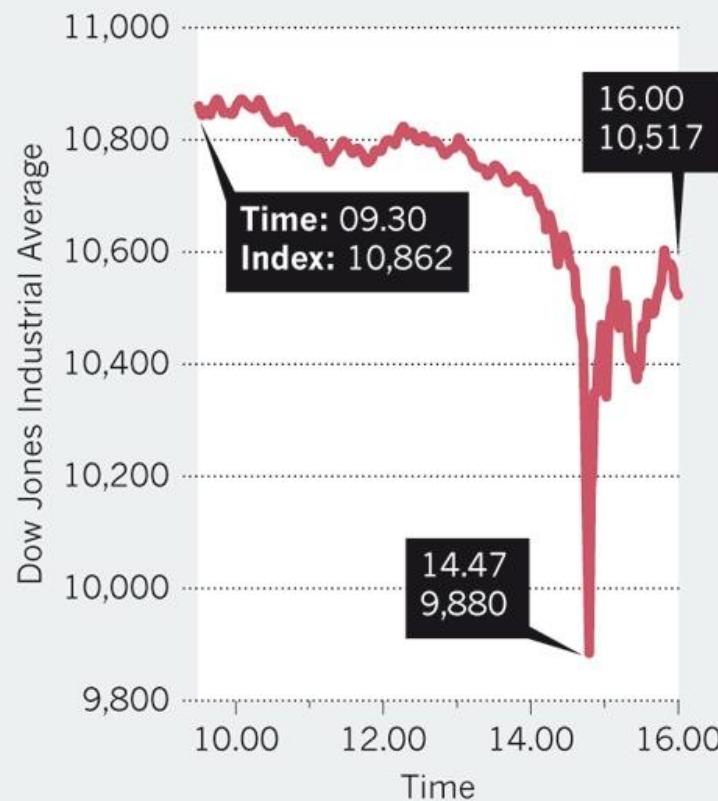

„visokofrekvenčno“ borzno trgovanje omč

A software glitch at trading firm Knight Capital caused losses of US\$440 million in a single day in 2012.

FLASH CRASH

On 6 May 2010, the market value of the Dow Jones Industrial Average index fell by 9%, but recovered in minutes. High-speed trading algorithms were in part to blame.

Trading at the speed of light

obstoječe naprave za uravnavanje toka svetlobe med vlakni:

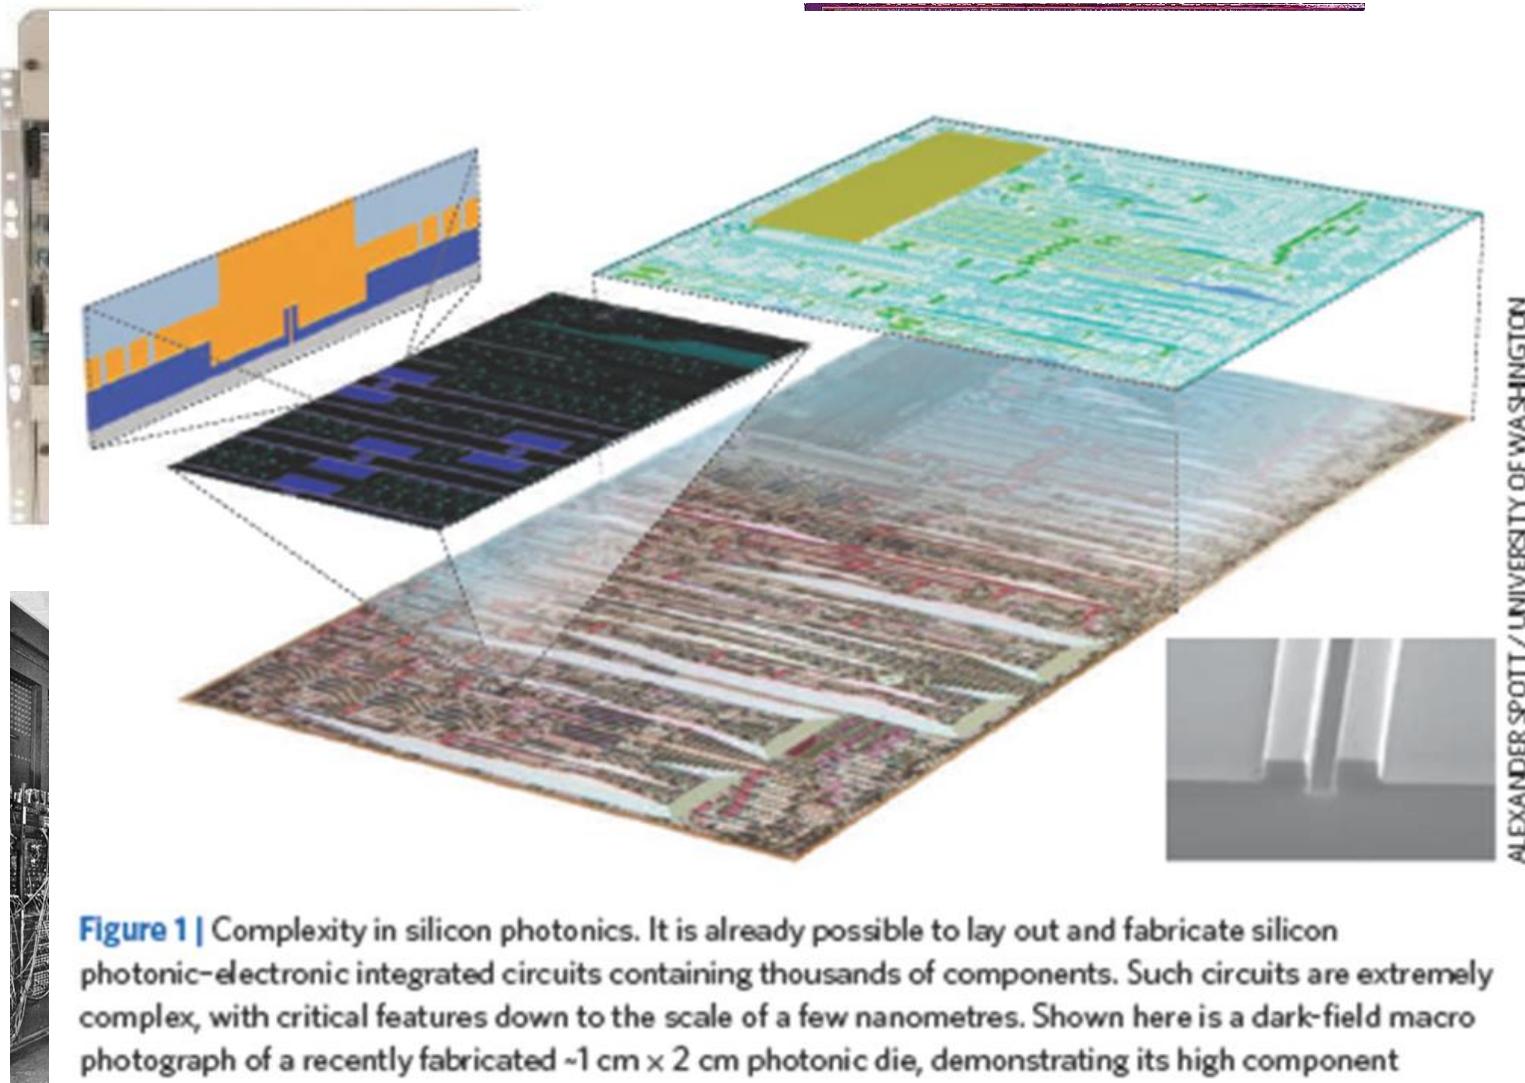

Figure 1 | Complexity in silicon photonics. It is already possible to lay out and fabricate silicon photonic-electronic integrated circuits containing thousands of components. Such circuits are extremely complex, with critical features down to the scale of a few nanometres. Shown here is a dark-field macro photograph of a recently fabricated ~1 cm x 2 cm photonic die, demonstrating its high component

Zakaj fotonika?

Zakaj bi raje uporabili fotone kot elektrone?

- Količina podatkov raste hitreje kot računska moč.
- Silicijevi procesorji so dosegli svojo največjo hitrost takta 3 do 4 GHz
- Težave s hlajenjem nanostruktur: procesorji se „talijo“
- Težave z zakasnitvami električnih signalov in latenco,
- Poraba energije: serverji in računalniki v ZDA porabijo 2-3% skupne električne moči!
- leta 2050 bodo podatkovni centri v EU porabili toliko energije, kot jo sedaj porabi celotna EU!
- Povečujejo se potrebe po številu optičnih komunikacijskih kanalov.

Integrirana fotonska vezja na osnovi trdne snovi:

Bogaerts et al. Laser Photonics Review 6, 47(2012)

Prednosti fotonike na osnovi trdne snovi:

- Silicijeva tehnologija, CMOS kompatibilna
- 50+ let razvoja, predvidljiv in zanesljiv napredek v majhnih korakih.

Slabe strani fotonike na osnovi trdne snovi:

- 2D planarna tehnologija, težak prehod v 3D arhitekturo
- Poraba električne moči: električni tok
- Velike svetlobne izgube zaradi „grobe“ tehnologije izdelave

Ali je kakšna radikalna alternativa?

1. Ali lahko uporabimo mehko snov in kompleksne tekočine za izdelavo fotonskih vezij?
2. Ali lahko izdelamo mikrolaserje, mikrovlakna in hitra optična stikala iz mehke snovi-tekočih kristalov?

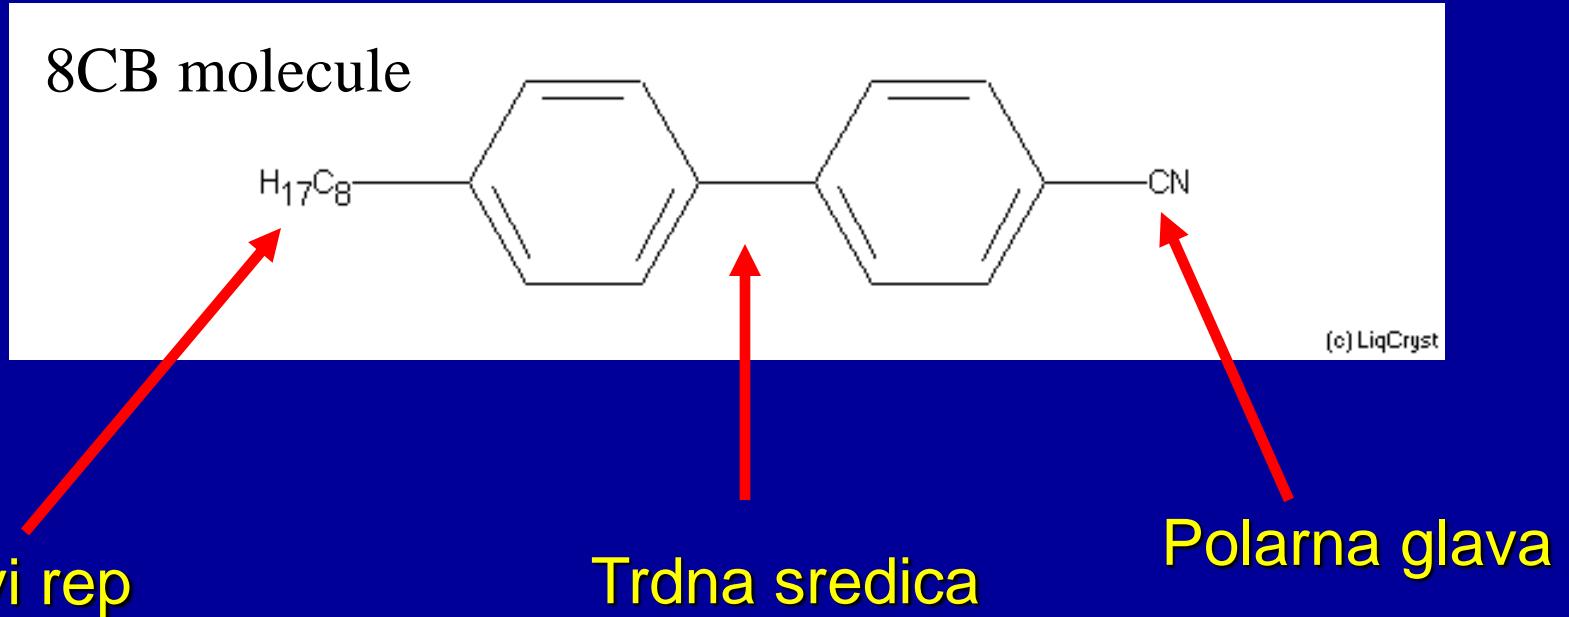

Zakaj?

1. Mehka snov je samo-sestavljava v 3D
2. Mehka (biološka) snov lahko raste, se celi in sama popravi
3. Mehka snov tvori osupljivo kompleksne fotonske strukture

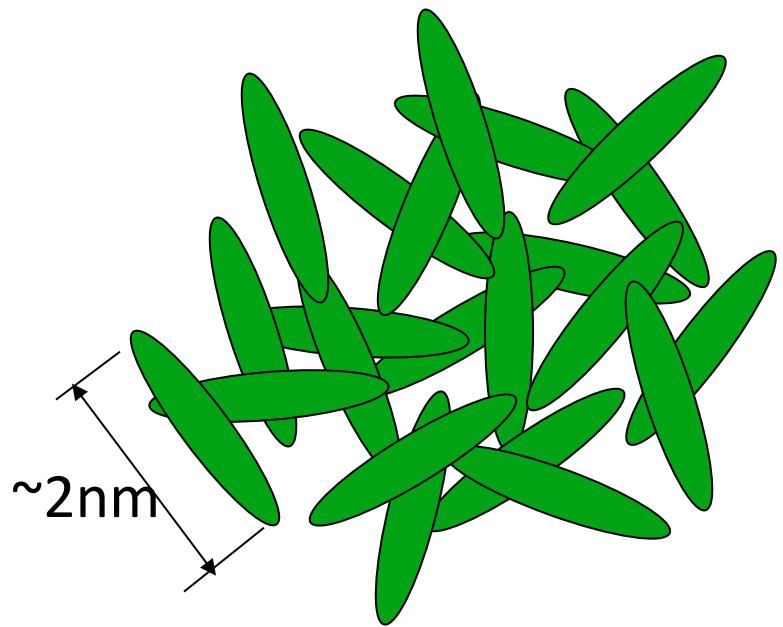

Tekoči kristali

Moleklna struktura tipičnega tekočega kristala

16 December 2013 | Vol. 21, No. 25 | DOI:10.1364/OE.21.030233 | OPTICS EXPRESS 30233

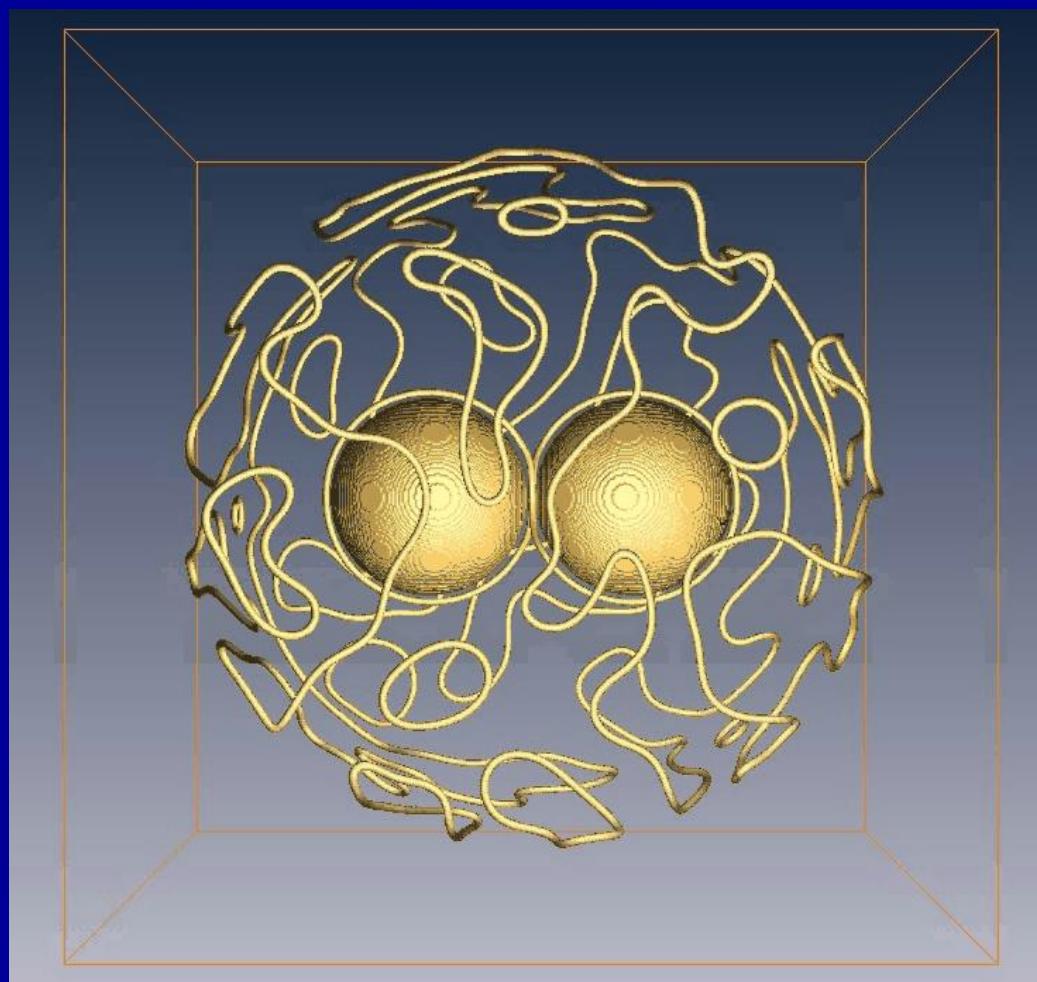

The screenshot shows the homepage of Optics InfoBase. At the top, there's a navigation bar with 'OSA' on the left and links for 'Contact Us', 'Login', 'Login Benefits', and 'My InfoBase'. Below the header, the 'OpticsInfoBase' logo is prominently displayed, with 'OSA's Digital Library' underneath. A dropdown menu 'Select Another Publication' is visible. The main content area features a banner for 'Spotlight on Optics | HIGHLIGHTED ARTICLES FROM OSA JOURNALS December 2013'. On the left, a sidebar menu includes links for 'Home', 'Previous Spotlights', 'About', 'Using Optics InfoBase', 'Authors', 'Librarians', and 'Subscribe'. The central content area displays the article abstract: 'Lasing and waveguiding in smectic A liquid crystal optical fibers'. It includes a small thumbnail image of a fiber, the authors' names, and links to the source article abstract, full text in XHTML, and full text in PDF. To the right, there's a search interface with 'Journal Search' and 'Article Lookup' tabs, a dropdown for 'Optics InfoBase', a search input field, and a 'Go' button. Below the search is a link to 'Advanced Search'. At the bottom of the page, there's a 'Previous Spotlights' section for the year 2013.

REPORTS

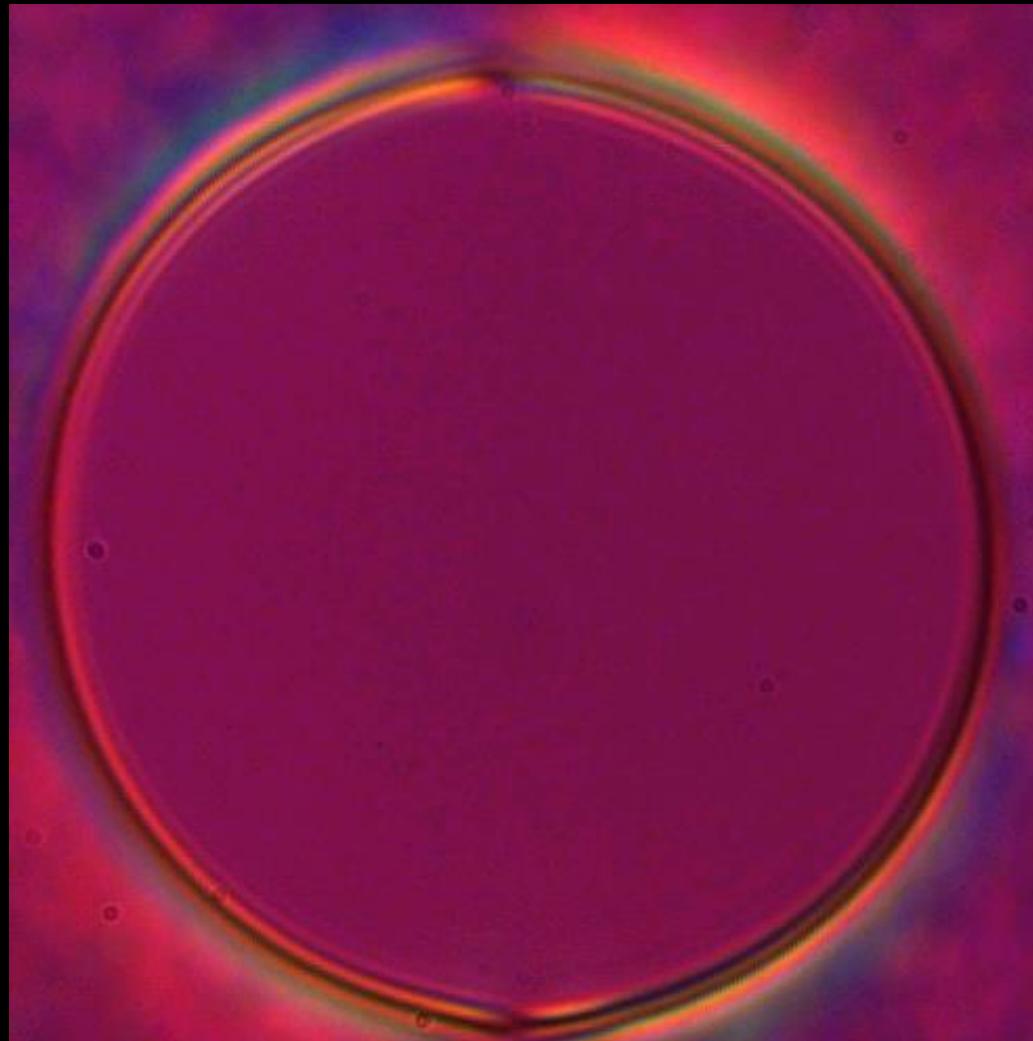

Reconfigurable Knots and Links in Chiral Nematic Colloids

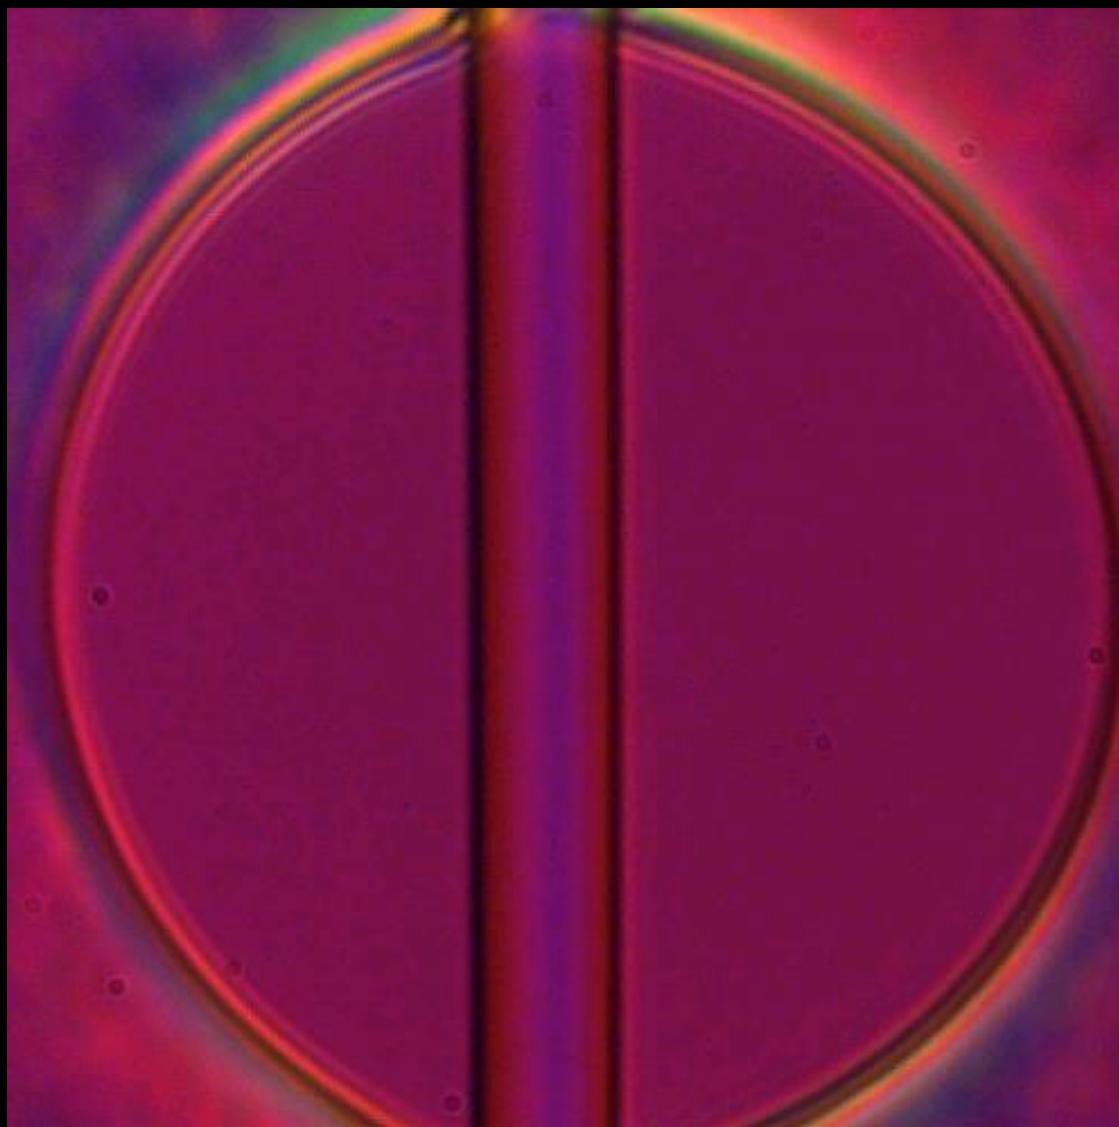

Uroš Tkalec,^{1,*†} Miha Ravnik,^{2,3} Simon Čopar,³ Slobodan Žumer,^{1,3} Igor Mušević^{1,3*}

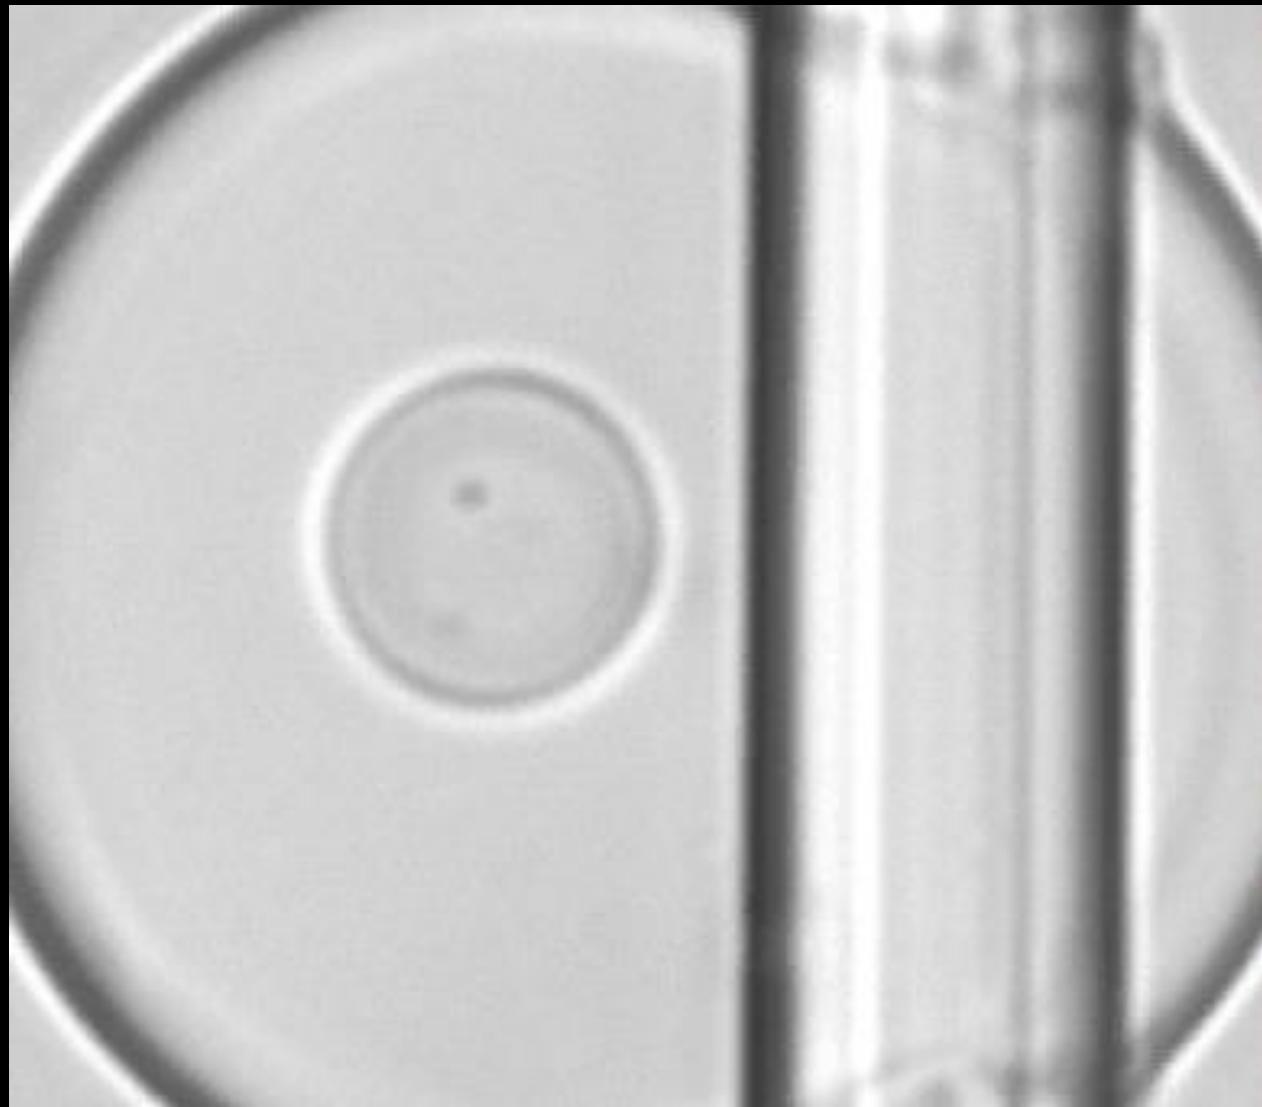

Tying knots and linking microscopic loops of polymers, macromolecules, or defect lines in complex materials is a challenging task for material scientists. We demonstrate the knotting of microscopic topological defect lines in chiral nematic liquid-crystal colloids into knots and links of arbitrary

are created. Each particle is encircled by its own micro-loop, also called a Saturn's ring, in which the degree of molecular order is reduced in the ~10-nm-thick core, and the director exhibits fast spatial variations, making the rings visible under an optical microscope (*16*). The Saturn's ring behaves as an elastic strip that can be stretched and deformed with laser tweezers (*17–20*). More importantly, several Saturn's rings can be fused together by using the laser tweezers to entangle a pair or multiple colloidal particles (*21, 22*). Here,

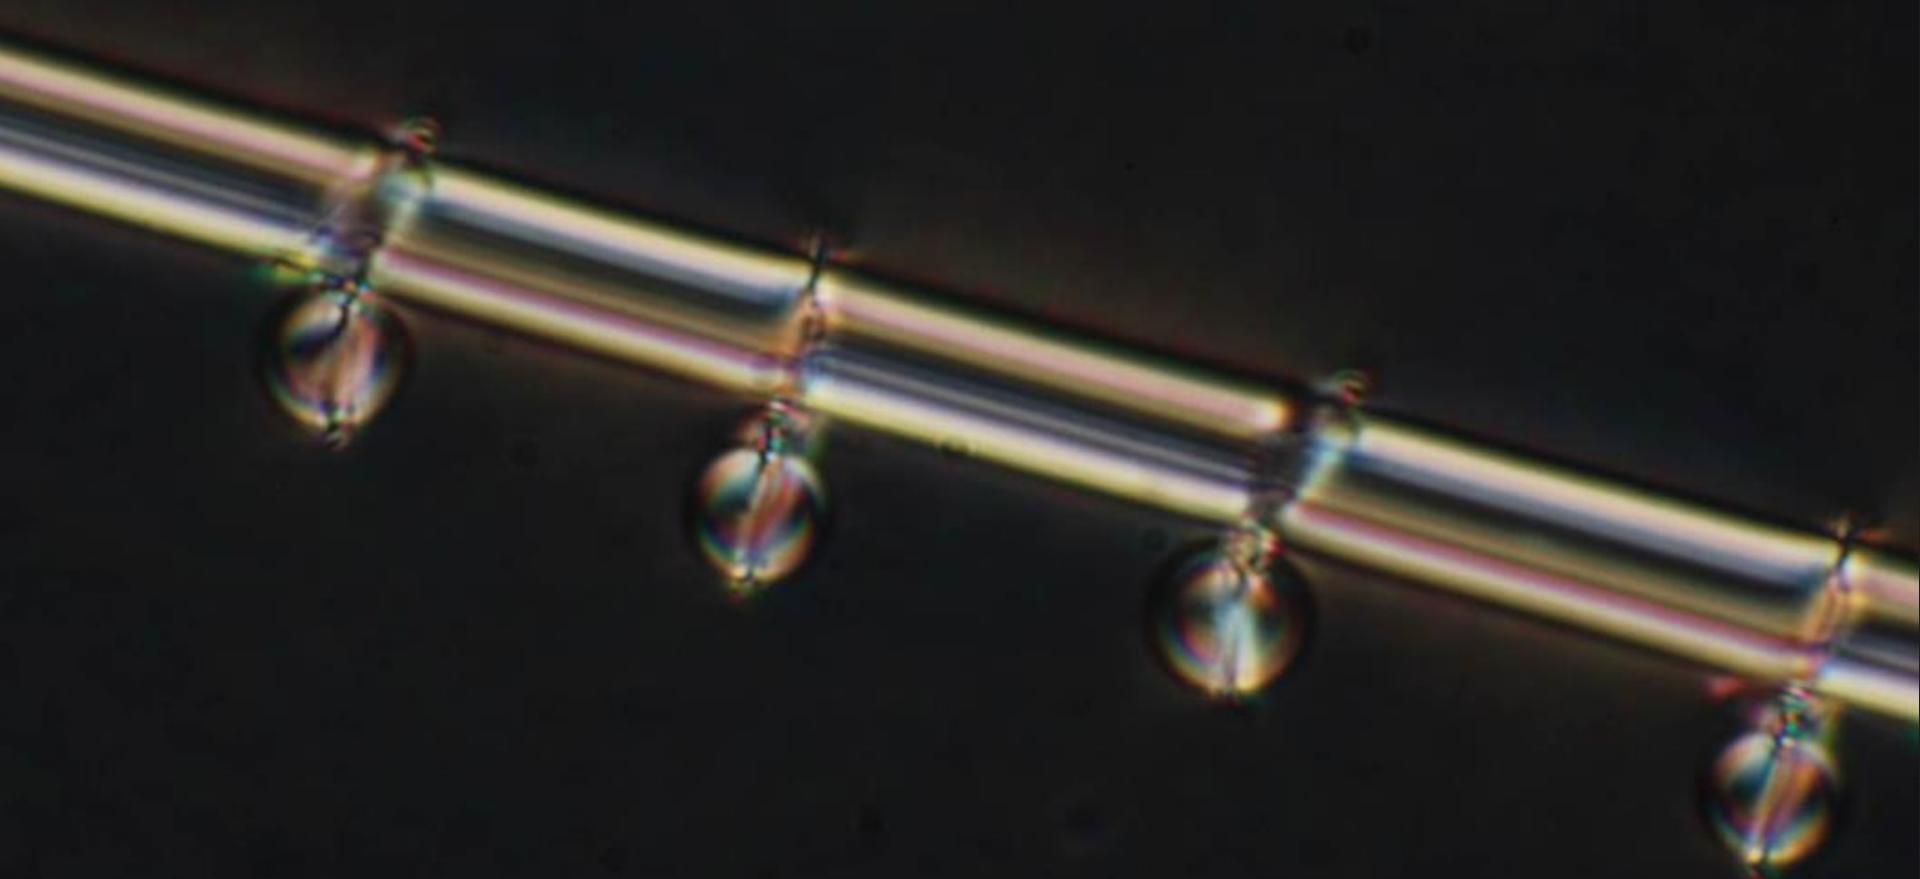

Topologijo uporabljam za vezavo elementov:

Izdelamo lahko zanimive strukture, ki so osnova za bodoča vezja

Zaključek

- Iz tekočih kristalov lahko izdelavo vse osnovne elemente za svetlobna vezja.
- Svetlobni elementi so tekoči, oblikuje jih zgolj površinska napetost.
- V teh snoveh opazimo množico zanimivih topoloških defektov (tudi vozli in spletji).
- Pokazali smo, da lahko na svetlobo v teh elementih učinkujemo z drugo svetlobo.
- Vsi elementi so lahko bio-kompatibilni.
